

How presentation is done in Universe Docs?

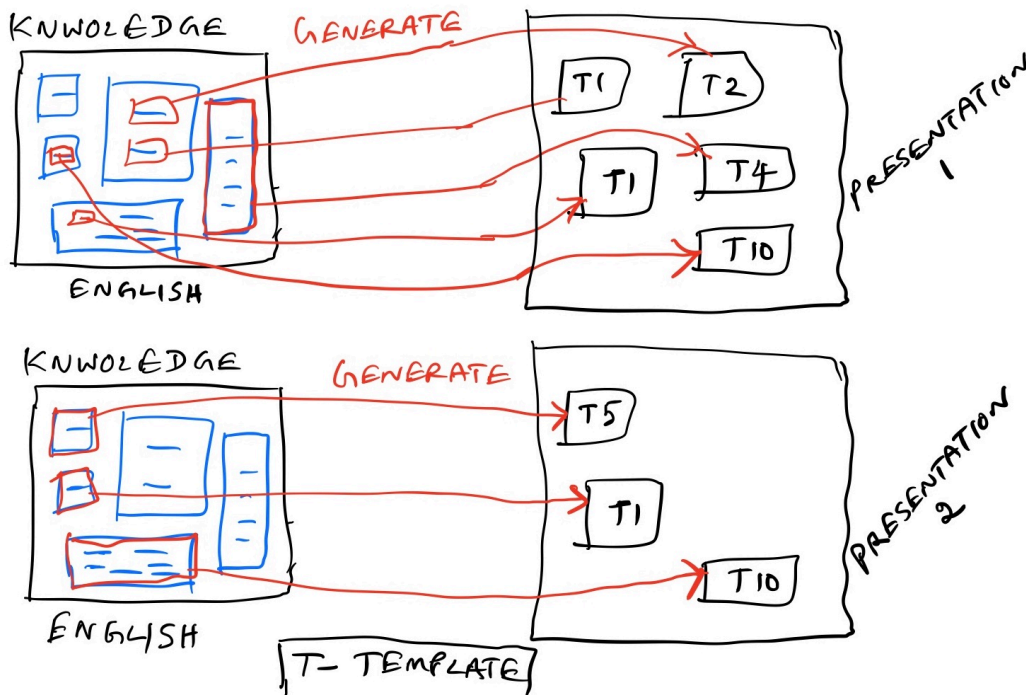

In above diagram as an analogy the human presenter has knowledge. He uses the same knowledge to do presentation in different ways in different languages. You have to note the presentation is generated by the human when needed on the black board. So when there is a change in the knowledge then automatically on next presentation contents will change! In softwares like MS Powerpoint, Keynote, etc., document presentation tool not doing like humans!

HUMAN BRAIN

DOCUMENTS
IN HUMAN
BRAIN

Knowledge in the human brain as documents. Each document can have different representation. Some may have same representation.

In my software "Universe Docs" the knowledge is represented as set of documents (blue rectangles) as in left side similar to human brain. The human selects parts of documents (red colour markings) and makes presentations that looks different on the right side. Each presentation can use one or more templates for each parts of the documents in left side.

For example a template will have bullet point lines on the left and a picture at the right. Another example will have a graph with several nodes.

The presentations on the right are generated on the fly but don't have separate document.

When there is a change in the documents in left side for which the presentation refers then there will be automatically change in the presentation. Similarly for each language (english, hindi, etc.,)

Where as in the current system like MS Powerpoint and Keynote, there is a separate document for presentation and the content is duplicated from the main document. When there is a change in the documents there will be no change in the separate presentation document. Human as to make the changes manually in all the documents. "Universe Docs" reduces manual work and duplication.

Hope you understand the advantages of "Universe Docs" now. If not we have a meeting!
